not considered feasible and reasonable may meet the established criteria and be reasonable during the final design noise analysis. Conversely, noise walls that were found to be feasible and reasonable during the preliminary noise analysis may not be found feasible during the final design stage. As such, noise walls that are found to be feasible are recommended for construction or the acquisition of right of way.

These plans are unfinished and unapproved and are not to be used for any type of construction or the acquisition of right of way.
